(Received 15 October 2007, accepted 17 December 2007)

Abstract: This article evaluates FDI’s influence on Jiangsu’s economic development by quantificational method, and analyzes effects of capital investment on Jiangsu’s economic growth. To understand relationships of FDI and Jiangsu’s Economic development, will help Jiangsu Province utilizing FDI better and more effective.

Key words: FDI; economic development; relationship; analyze

1 Introduction

Capital shortage is the common problem faced by the developing countries and it’s also the to-be-solved problem for China’s economic development. The development of economic globalization strengthens the capability of capital cross-border flow and makes the capital globalization a trend. The characteristic of the globalization is the competition on FDI attraction in the whole world. Most countries adopt the liberalization to the investment field and their economic departments are open to foreign investors[1]. Foreign capital can be supplement for capital deficiency, support the construction of infrastructures and other weak fields of economic development. But the most important thing is that foreign capital creates a short cut for Chinese enterprises to participate international economic cooperation and competition. Since Chinas opening to the outside world at the end of 1970s and its entry into the WTO, Chinese globalization has been facilitated[2]. China has absorbed a large amount of foreign capital. By the end of 2006, the accumulated FDI reached about 704 billion USD in China from about 200 countries and regions all over the world. And about 480 companies listed in World Top 500 have invested in China. Jiangsu Province is located in Yangtze Delta, which is the most economic developed area in China. And it is one of the provinces with most foreign investment. From year 2002, the actual utilized foreign capital in Jiangsu Province increases over 10 billion USD every year to reach 17.4 billion USD in year 2006. Among the World Top 500 companies, 385 companies have invested in Jiangsu. As we known, most economic growth theories regard economic growth as the function of capital, technology, employment and so on[3]. Thus, large amount of FDI accelerates economic development and promotes foreign trade in Jiangsu. This article focuses on studying the association between FDI and Jiangsu’s economic development.

2 The association between foreign investment and Jiangsu’s economic development

From the empirical analysis of Jiangsu Province, the attraction of foreign investment stimulates the economic development in Jiangsu Province[4].To study the association between foreign investment and Jiangsu’s economic development, we use coefficient of correlation among variables of mathematical statistics. In Eq.
\( \gamma \) is the coefficient of correlation between variable \( X \) and \( Y \), \( X \) is the investment index, \( Y \) is other relative economic index, such as GDP, etc., \( L_{xy} \) is the covariance between \( X \) and \( Y \), \( L_{xx} \) and \( L_{yy} \) are the variance of \( X \) and \( Y \) respectively. The coefficient of correlation[5] is:

\[
\gamma = \frac{L_{xy}}{\sqrt{L_{xx}L_{yy}}}
\]  

(1)

Normally, when \( \gamma \leq 1 \) and \( \gamma \) is closer to 1, the association between \( X \) and \( Y \) is closer. Contrarily, the association is looser.

According to the data listed in Table 1, the coefficient of correlation between Jiangsu’s foreign investment and relative economic index can be calculated by Eq. (1).

### Table 1: Utilized foreign investment and relative economic variable in Jiangsu Province

</tr>
</tbody>
</table>

\( Y \): RMB 10000.00 yuan. \( X \): USD 10000.00

Source: Provincial economy and social development statistical report of Jiangsu

The coefficient of correlation between the actual foreign investment in Jiangsu (X) and GDP (Y) \( \gamma_{xy} \) = 0.878511303. Now test the association. Let \( \partial = 0.01 \), then \( \gamma_0 (n - 2) = \gamma_{0.01} (8) = 0.7646 \), \( \gamma_{xy} > \gamma_{0.01} (8) \)

The result shows obviously positive correlation between the foreign investment and GDP, which shows that the foreign investment promote the increase of GDP in Jiangsu.

### 3 The Influence by Foreign Investment to Jiangsu’s Economic Development

Considering capital, labor and technology improvement, gross production function can be described by the following equation[6] as:

\[
Y_t = F(k, l, t) = A_0e^{mt}l^\alpha k^\beta
\]  

(2)

In which, \( Y_t \), \( k \), \( l \) are the GDP and capital and labor respectively. \( \alpha \), \( \beta \) are the output flexibility coefficient of labor and capital respectively. \( m \) is the coefficient of technology improvement. Eq. (2) is the basic model of analyzing modern economic development. From Eq. (2) we can get:

\[
\ln y = \alpha \ln l + \beta \ln k + mt + \ln A_0
\]

(3)

in which \( \alpha + \beta = 1 \). Rewrite Eq.(3) to

\[
\ln \frac{y}{l} = \beta \ln \frac{k}{l} + mt + \ln A_0
\]  

(4)

Let \( \ln \frac{y}{l} = \theta \), \( \ln \frac{k}{l} = p \), \( \ln A_0 = \alpha_0 \). Then

\[
\theta = \beta p + mt + \alpha_0
\]  

(5)

Eq. (5) is a linear regression equation. According to the least-square method to solve for parameter \( \alpha_0 \), \( \alpha \), \( \beta \), \( m \), the standard equation is:

\[
\sum \theta = n\alpha_0 + \beta \sum p + m \sum t \\
\sum t\theta = \alpha_0 \sum t + \beta \sum pt + m \sum t^2 \\
\sum p\theta = \alpha_0 \sum p + \beta \sum p^2 + m \sum pt
\]

IJNS homepage: http://www.nonlinearscience.org.uk/
In the time series design, \( \sum t = 0 \) so the Eq.(6) can be simplified as:

\[
\begin{align*}
\sum \theta &= n\alpha_0 + \beta \sum p \\
\sum t\theta &= \beta \sum pt + m \sum t^2 \\
\sum p\theta &= \alpha_0 \sum p + \beta \sum p^2 + m \sum pt
\end{align*}
\]

(6)

To quantitatively analyzing the influence by foreign investment to Jiangsu’s economic development according to Eq. (7).

</tbody>
</table>

Solving for $\alpha$, $\beta$, $\alpha_0$, $m$, we find that:

$\alpha = 0.441$ $\beta = 0.559$ $\alpha_0 = 0.9263$ $m = 0.01635$

It shows that capital output flexibility coefficient is 0.559.

The average development rate by capital injection is:

$$\frac{\Delta K}{K} = \sqrt[10063.65]{\frac{2203.09}{} - 1} = 0.1838661068$$

Then the contribution by the capital to economic development is:

$$\beta \frac{\Delta K}{K} = 0.10278115$$

Let $R$ be the proportion of actual FDI in Jiangsu to social fixed asset investment between year 1997 to 2006:

$$R = 0.171109052$$

Then the average contribution of FDI to Jiangsu’s economic development within 10 years:

$$\beta \frac{\Delta K}{K} \times R = 0.01758679$$

The average Jiangsu’s economic development rate between year 1997 to 2005 is:

$$\frac{\Delta Y}{Y} = \sqrt[21548.36]{\frac{6680.34}{} - 1} = 0.1389714832$$

Then the proportion of actual FDI in Jiangsu to its economic development is:

$$\beta \frac{\Delta K}{K} \times R \div \frac{\Delta Y}{Y} = 12.65496\%$$

The result shows that Jiangsu’s economy increased $1.758679\%$ in average during 1997 to 2006 based on the effect of FDI. And the contribution of FDI to Jiangsu’s economic development is $12.65496\%$.

Now, we consider to the contribution by the technology improvement to economic development[7] is:

$$M = \frac{\Delta Y}{Y} - \left(\alpha \frac{\Delta L}{L} - \beta \frac{\Delta K}{K}\right) = 3.425948\%$$

The result shows that Jiangsu’s economy increased $3.425948\%$ in average during 1997 to 2006 based on technology improvement.

Thus it can be seen that technology improvement is the main impetus for Jiangsu’s economic growth. From the fact in Jiangsu, the capital & technology density of foreign invested enterprises is much higher than that of domestic enterprises. Then we can think that foreign invested enterprises are the main contributors to Jiangsu’s economic development. Foreign invested enterprises play important roles in Jiangsu’s economic development.
4 Conclusion

Jiangsu’s economic development is obviously positive correlation with FDI, which means FDI promotes the increase of Jiangsu’s GDP and Gross Industry Output. Based on capital and technology improvement, Jiangsu’s economy increased 1.758679% and 3.425948% in average during 1997 to 2006 respectively. Foreign invested enterprise play important roles in Jiangsu’s economic development, and become main contributors to Jiangsu’s economic growth.
