# The Economic Factors Analysis in Olympic Game 

Yong Jiang, Tingting Ma, Zhe Huang<br>Faculty of Mathematics and Physics, Nanjing University of Information Science \&Technology, 210044

(Received February 22, 2010, accepted March 21, 2010)

#### Abstract

In recent years, our country economic development tendency was encouraging, and the speed of catching up with developed countries is faster and faster. Athletics sports result is better than other countries at 29 Olympic Games hold in Beijing. Rapid economic growth is clearly to promote the development of sports. This paper will establish a multiple regression model by gold medals and weighted total medals to analyze the economic factors which affect the Olympic medals.

Keywords: economic factors, Olympic medal.

## 1. Introduction

Chinese sports delegation made 51 gold MEDALS and 100 MEDALS in Beijing Olympic Games in 2008. It is the first time for China to get No. 1 instead of America. It is the best achievement to China since we take part in the Olympic Games. It is also a surmounting for China to advance to the modern Olympics movement powerful nation. It is affirmation to the Chinese sports development and also a great contribution to modern Olympics movement by Chinese nation. We break the record that the gold or medal is zero in many projects. This result has roused the national spirit enormously, and unfolded Chinese's sports strength to the common people. At the same time, we can not help but consider what factors are promoting our grow behind this achievement? What factors associated with the strength of a country's sports competition? This article in view of this fact is going to analyze the contact between national sports scores and various factors by multiple regression model. The Olympic Games' event is numerous and there do not have the direct absolute index to weight country result. Then the medal number may show the question to a certain extent. This paper will establish a multiple regression model by gold medals and weighted total medals to analyze the economic factors which affect the Olympic medals.

## 2. The choice of data and economic factors

We first check the information on the 2008 Beijing Olympic Games, reorganizes as follows:
Table 1 medals won situation of 2008

| country | gold | silver | bronze | Total medals |
| :---: | :---: | :---: | :---: | :---: |
| China | 51 | 21 | 28 | 100 |
| America | 36 | 38 | 36 | 110 |
| England | 19 | 13 | 15 | 47 |
| Germany | 16 | 10 | 15 | 41 |
| Australia | 14 | 15 | 17 | 46 |
| South Korea | 13 | 10 | 8 | 31 |
| Japan | 9 | 10 | 10 | 25 |
| Italia | 8 | 11 | 10 | 28 |
| France | 7 | 16 | 17 | 40 |
| Ukraine | 7 | 5 | 15 | 27 |
| The Dutch | 7 | 5 | 4 | 16 |
| Spain | 5 | 10 | 3 | 18 |
| Canada | 3 | 9 | 6 | 18 |
| Brazil | 3 | 4 | 8 | 15 |
| New Zealand | 3 | 1 | 5 | 9 |

Table 2 Independent variables and observation

| Italia | 0.8 | 0.3 | 421.2 | 104.8 | 95.4 | 95.7 |
| France | 1.7 | 1 | 463.8 | 116.4 | 100 | 98.1 |
| Ukraine | 5 | 10.2 | 573.5 | 166.9 | 116.1 | 119.8 |
| The <br> Dutch | 2.8 | -1.4 | 438.3 | 110.2 | 93 | 91.1 |
| Spain | 3.0 | 2 | 477.8 | 122 | 103.4 | 102.5 |
| Canada | 2.2 | 1.1 | 490.8 | 128.4 | 101.8 | 98.7 |
| Brazil | 2.2 | -1.4 | 464 | 124 | 125.4 | 119.3 |
| New <br> Zealand | 3.9 | 1.8 | 443 | 114.6 | 114.2 | 110.8 |

As we all know, economy is the primary factor to influence the development of competitive sports. So we first consider the country's gross domestic product. The Olympic Games are held every four years, so we calculate four years’ GNP sum between two Olympics. But during the computation, we find the gross national product and various countries' Olympic Games result have no linear relationship nearly. So we decide to use gross national product's average annual rate of growth and the industry and agriculture produces and another 12 factors as independent variable to analyze. We chose 15 countries to have a discussion.

In the table, industrial output index is on the base of 2000. 08 agricultural production index, 08 per capita agricultural production index is the base of total output value for 2000 index. The data of population density and health and social work personnel quantity is from 2007.

Human Development Index is a measure of human development which is the average achievements in three aspects of a comprehensive index: Health and longevity of life (with birth life expectancy to represent); Knowledge using adult literacy rate and large middle and primary school to represent); A decent living standards (with measured at purchasing power parity method to calculate the per capita GDP to represent). On this basis, we use the weighted average method to calculate the index of the three areas, then average the three indexes.

Education index is one of the three component indexes which published by the United Nations development program. It measured by adult literacy rate ( $2 / 3$ weight) and elementary school, high school, college comprehensive enrollment rate ( $1 / 3$ weight).

| Canada | 2.2 | 1.1 | 490.8 | 128.4 | 101.8 | 98.7 |
| Brazil | 2.2 | -1.4 | 464 | 124 | 125.4 | 119.3 |
| New Zealand | 3.9 | 1.8 | 443 | 114.6 | 114.2 | 110.8 |

This article analyzes the contact between medals and economic factors by multiple linear regression analysis. China is a developing nation of the world, we should pay attention to various aspects when the economic takes off. Sports is one hand which can also show our new look and comprehensive national strength. And the main objective of sports statistics is to establish the core index of the statistical data every year which can reflect the basic condition of Chinese sports industry development.. At the same time, make sound
the index system of sports industry development which can be accurate, comprehensive and systematic reflected by special investigation or economic census. People constantly describe, analyze, control and forecast the quantity relationship in market economy by regression forecast. This method will surely make great contribution to the development of physical culture.

We take a group of economic factor as independent variables to reorganize the above material.
Renewal table 3

## 4. Analysis

We first analyze the number of gold medals as the achievement of a country in the game and synthesizes 2 and 3 . The result computed by mathematica is:

Table 4

| Dependent <br> variable | independe <br> nt | Regression equation | $R^{2}$ | $t$ | $F$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $y_{1}$ | $x_{1}$ | $y_{1}=8.1144+0.7682 x_{1}$ | 0.6482 | 3.8252 | 10.809 |
| $y_{2}$ | $x_{2}$ | $y_{2}=8.2924+0.8885 x_{2}$ | 0.5218 | 2.1969 | 8.33 |
| $y_{3}$ | $x_{3}$ | $y_{3}=-6.0074+0.0336 x_{3}$ | 0.6232 | 1.8243 | 9.328 |
| $y_{4}$ | $x_{4}$ | $y_{4}=-1.4935+0.0913 x_{4}$ | 0.1352 | 1.5818 | 2.502 |
| $y_{5}$ | $x_{5}$ | $y_{5}=7.7017+0.028 x_{5}$ | 0.4096 | 3.1325 | 7.56 |
| $y_{6}$ | $x_{6}$ | $y_{6}=12.1411-0.0142 x_{6}$ | 0.548 | -2.0651 | 9.238 |
| $y_{7}$ | $x_{7}$ | $y_{7}=5.6450+0.0033 x_{7}$ | 0.543 | 2.1510 | 4.627 |
| $y_{8}$ | $x_{8}$ | $y_{8}=-2.6133+1.6328 x_{8}$ | 0.619 | 1.8450 | 8.045 |
| $y_{9}$ | $x_{9}$ | $y_{9}=13.7681-0.0349 x_{9}$ | 0.4023 | -3.1060 | 1.24 |
| $y_{10}$ | $x_{10}$ | $y_{10}=67.4741-0.5980 x_{10}$ | 0.3884 | -2.0859 | 3.179 |
| $y_{11}$ | $x_{11}$ | $y_{11}=10.2226+0.0032 x_{11}$ | 0.38181 | 2.1703 | 2.901 |
| $y_{12}$ | $x_{12}$ | $y_{12}=-4.4494+0.1204 x_{12}$ | 0.1622 | 0.0975 | 3.098 |

$$
t_{0.05}(13)=1.7709
$$

Because of $\left|\mathrm{t}_{4}\right|<t_{0.05}(13),\left|\mathrm{t}_{12}\right|<t_{0.05}(13)$, so $x_{4}$ and $x_{12}$ can be deleted.
The results showed that 08 industrial production index and health and social workers had not through significant test, and $x_{1}, x_{2}, x_{3}, x_{5}, x_{7}, x_{8}$, are all through significant test. That means they have the remarkable linear relationship with the sports result. And $x_{1}, x_{7}$ is more remarkable. To industry, $x_{3}$ is more remarkable than $X_{4}, X_{8}$ is more remarkable than $X_{7}$.

Then we Construct the multiple regression equation of the dependent variable with all variables. We get the result:

$$
\begin{aligned}
y= & 123.5794-1.1028 x_{1}+2.5504 x_{2}+0.2464 x_{3}-1.1660 x_{4}+0.7791 x_{5}-0.9498 x_{6} \\
& +0.0052 x_{7}+0.9257 x_{8}-1.0869 x_{9}-0.5222 x_{10}+0.0191 x_{11}+0.4837 x_{12} \\
R^{2}= & 0.9525, F=8.357 .
\end{aligned}
$$

We can see that the data $95.25 \%$ can be explained by the model at the confidence for 0.95 circumstances. But, the regression coefficients of $x_{1}$ is negative. So when $x_{1}$ is larger, the scores of the country at the Olympics will decline. It's of course not true. The model is not established.

Then we removed $x_{4}$ and $x_{12}$, there is another model:

$$
\begin{aligned}
& y=131.9158+1.7627 x_{1}+0.4786 x_{2}+0.0230 x_{3}-0.4360 x_{5}+0.1849 x_{6} \\
& \quad+0.0044 x_{7}+2.0633 x_{8}+0.0421 x_{9}-1.4858 x_{10}+0.0090 x_{11} \\
& t_{1}=3.6566, \quad t_{2}=2.4379, \quad t_{3}=3.8033, \quad t_{5}=-4.8298, \quad t_{6}=3.4656 \\
& , \quad t_{7}=2.2432, \quad t_{8}=4.9616, \quad t_{9}=-3.0754, \quad t_{10}=-2.4671, \quad t_{11}=2.5771 \\
& F_{0.05}(10,4)=5.96, t_{0.05}(4)=2.1318, R^{2}=0.9093, F=7.021 .
\end{aligned}
$$

Table 5

| Dependent <br> variable | independent | Regression equation | $R^{2}$ | $t$ | $F$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $y_{1}$ | $x_{1}$ | $y_{1}=74.6637+2.7601 x_{1}$ | 0.6406 | 4.4031 | 9.625 |
| $y_{2}$ | $x_{2}$ | $y_{2}=72.4508+4.2596 x_{2}$ | 0.5605 | 2.7735 | 5.984 |
| $y_{3}$ | $x_{3}$ | $y_{3}=-16.6557+0.2023 x_{3}$ | 0.6194 | 3.4726 | 8.169 |
| $y_{4}$ | $x_{4}$ | $y_{4}=15.2371+0.5153 x_{4}$ | 0.08212 | 1.1965 | 0.732 |
| $y_{5}$ | $x_{5}$ | $y_{5}=122.4668-0.3646 x_{5}$ | 0.6355 | -6.2388 | 7.702 |
| $y_{6}$ | $x_{6}$ | $y_{6}=153.6866-0.6749 x_{6}$ | 0.5134 | -5.4285 | 8.36 |
| $y_{7}$ | $x_{7}$ | $y_{7}=39.5925+0.0291 x_{7}$ | 0.5323 | 2.8216 | 7.961 |
| $y_{8}$ | $x_{8}$ | $y_{8}=-37.5334+14.9221 x_{8}$ | 0.6254 | 2.3394 | 8.473 |
| $y_{9}$ | $x_{9}$ | $y_{9}=14.3998+0.7804 x_{9}$ | 0.4718 | 4.3290 | 10.82 |
| $y_{10}$ | $x_{10}$ | $y_{10}=317.4820-2.4595 x_{10}$ | 0.5216 | -3.6022 | 3.626 |
| $y_{11}$ | $x_{11}$ | $y_{11}=80.4106+0.0250 x_{11}$ | 0.2052 | 2.1814 | 3.29 |
| $y_{12}$ | $x_{12}$ | $y_{12}=-4.5841+0.7043 x_{12}$ | 0.059 | 1.3768 | 0.96 |

We can see from the table, $t_{i}>t_{0.05}(4) i=1,2,3,5, \cdots 11$. All variables passed the test of significance and $F>F_{0.05}(10,4)$. The model is right. Then we know when $x_{1}$ is positive it means average growth rate of

GDP increases, at the same time, sports result rise. It's the same to $x_{2}, x_{3}, x_{6}, x_{7}, x_{8}, x_{11}$. But the situation is opposite to $x_{5}, ~ x_{9}, ~ x_{10}$. That's because we don't have enough money to develop sports when having invested too much in agriculture and the humanities education. So this model is better than last one.

Then we analyze the weighted total medals as the achievement of a country in the game.
According to gold, silver and bronze medals, we give out different weight. Gold is 5 , silver is 2 , bronze is 1 . We get the formula: $y=5 a+2 b+c$.
$a, b, c$ is the number of medal.

$$
t_{0.05}(13)=1.7709
$$

Because of $\left|\mathrm{t}_{4}\right|<t_{0.05}(13),\left|\mathrm{t}_{12}\right|<t_{0.05}(13)$, so $x_{4}$ and $x_{12}$ can be deleted.
The results showed that 08 industrial production index and health and social workers had not through significant test, and $x_{1}, x_{2}, x_{3}, x_{5}, x_{7}, x_{8}$, are all through significant test. That means they have the remarkable linear relationship with the sports result. And $x_{1}, x_{7}$ is more remarkable. To industry, $x_{3}$ is more remarkable than $x_{4}, x_{8}$ is more remarkable than $x_{7}$.

Then we Construct the multiple regression equation of the dependent variable with all variables. We get the result:

$$
\begin{aligned}
y= & 779.3938-4.3290 x_{1}+17.8181 x_{2}+2.3057 x_{3}-7.8838 x_{4}+5.0331 x_{5}-6.6917 x_{6} \\
& +0.0320 x_{7}+19.8394 x_{8}-8.2939 x_{9}-2.0801 x_{10}+0.1640 x_{11}+0.7533 x_{12} . \\
R^{2}= & 0.9612, F=10.31 .
\end{aligned}
$$

We can see that the data $96.12 \%$ can be explained by the model at the confidence for 0.95 circumstances. But the regression coefficients of $x_{1}$ is negative. So when $x_{1}$ is larger, the scores of the country at the Olympics will decline. It's of course not true. The model is not established.

Then we removed $x_{4}$ and $x_{12}$, there is another model:

$$
\begin{aligned}
y= & 901.5606+13.6437 x_{1}+2.5568 x_{2}+0.1472 x_{3}-3.7648 x_{5}+1.4065 x_{6}+0.0254 x_{7} \\
& +22.5628 x_{8}-1.2511 x_{9}-8.5788 x_{10}+0.1064 x_{11} . \\
& t_{1}=4.2827, \quad t_{2}=3.3471, \quad t_{3}=2.7141, \quad t_{5}=-2.0628, \quad t_{6}=3.5255 \\
& , \quad t_{7}=4.0682, \quad t_{8}=3.5598, \quad t_{9}=-2.3324, \quad t_{10}=-2.1132, \quad t_{11}=3.0090 \\
& F_{0.05}(10,4)=5.96, t_{0.05}(4)=2.1318, R^{2}=0.9214, F=8.202 .
\end{aligned}
$$

We can see from the table, $t_{i}>t_{0.05}(4) i=1,2,3,5, \cdots 11$. All variables passed the test of significance and $F>F_{0.05}(10,4)$. The model is right. Then we know when $x_{1}$ is positive it means average growth rate of GDP increases, at the same time, sports result rise. It's the same to $x_{2}, x_{3}, x_{6}, x_{7}, x_{8}, x_{11}$. But the situation is opposite to $x_{5}, ~ x_{9}, ~ x_{10}$. That's because we don't have enough money to develop sports when having invested too much in agriculture and the humanities education. So this model is better than last one.

## 5. Conclusions

We can get the result after our analysis:

1. The predominant factor which affects a country's Olympic Games result are:
(1) Before Olympic Games, the growth rate of national product average in three years;
(2) The proportion that a country's spending on health care sharing of GDP in two Olympic Games period:
(3) education index of a country.
2. Olympic Games result is being related with the following factor:
(1) Before Olympic Games, the growth rate of national product average in three years;
(2) Before Olympic Games, the growth rate of per capita GDP in three years;
(3) Industrial total index in two Olympic Games period;
(4) per capita agricultural index in that year;
(5) The proportion that a country's spending on health care sharing of GDP in two Olympic Games period:
(6) Population density.

Negatively correlated with the following factors:
Agriculture Index in that year;
Human Development Index;
Education index
